## DESCRIPTION

**A light-emitting diode (LED)** is a two-lead semiconductor light source. It is a p–n junction diode, which emits light when activated. When a suitable voltage is applied to the leads, electrons are able to recombine with electron holes within the device, releasing energy in the form of photons. This effect is called **electroluminescence**, and the color of the light (corresponding to the energy of the photon) is determined by the energy band gap of the semiconductor.
