

PRODUCT NAME : Temperature Sensors
Module Thermistor for Arduino/R
aspberry-Pi/Robotics

PRICE : Rs 150.00

SKU : RM0784

DESCRIPTION

This sensors module is consisting one thermistor resistor. As per the property of thermistor resistor, the resistance goes low when temperature goes up. Now this resistor is combined with the breakout circuit which converts the analog values of the thermistor to Digital value. The circuit comes with an OP Amp LM358. When the resistance of the thermistor goes low the corresponding +ve voltage of the thermistor also decreases. When the +ve voltage goes below threshold voltage the signal pin goes high.
